Abstract: Given a (complete) metric space $X$, we denote by Lip($X$) the space of real-valued Lipschitz functions on $X$ and we equip it with the pointwise product. The purpose of this note is to describe those bijections $T : \text{Lip}(Y) \rightarrow \text{Lip}(X)$ which are “multiplicative” in the sense that whenever $f, g \in \text{Lip}(Y)$ are such that $f\cdot g \in \text{Lip}(Y)$ one has $T(f\cdot g) = T(f)T(g)$.

The main result of the paper states that if $X$ has no isolated points, then every multiplicative bijection $T : \text{Lip}(Y) \rightarrow \text{Lip}(X)$ arises as $T(f) = f \circ \tau$, where $\tau : X \rightarrow Y$ is a Lipschitz homeomorphism and so it is automatically linear.

We also give a description of the semigroup isomorphisms $T : \text{Lip}(Y) \rightarrow \text{Lip}(X)$ in the case where the underlying metric spaces are compact.

Key words: Semigroups of Lipschitz functions, homomorphism, representation.
